IN THE ABSTRACT

Please replace the abstract on page 17 with the following amended paragraph.

A method for computing a natural logarithm function includes partitioning a mantissa region between 1 and 2 into N equally spaced sub-regions; precomputing centerpoints a_i a reference point a_i of each of the N equally spaced sub-regions, where i=0,...,N-1; selecting N sufficiently large so that, within each sub-region, a first degree polynomial in m computes $\log(m)$ to within a preselected degree of accuracy for any m within the sub-region, where m is a mantissa of a binary floating point representation of a number; variable x; and computing a value of $\log(x)$ for a binary floating point representation of a particular number x stored in a memory of a computing device utilizing the first degree polynomial in m.
